## Abstract

Production and excretion of hydrogen (H<sub>2</sub>) gas in human was reported in 1969, since then it has been regarded as non-toxic molecule. For preventive and therapeutic medical uses, a possible treatment for cancer was reported and another article was published on how H<sub>2</sub> acts as a therapeutic antioxidant by selectively reducing cytotoxic oxygen radicals. A variety of H<sub>2</sub> gas inhalers have been available in the market for hospital and home uses. However, H<sub>2</sub> is odorless and flammable or explosive ignited by static electricity. We have examined the safety of a variety of H<sub>2</sub> gas concentrations from the viewpoint of flammability and explosion. We have also measured concentrations of H<sub>2</sub> gas inhalers in the market respectively. This paper also details how to control H<sub>2</sub> gas concentration for preventing explosions.

**Key words:** hydrogen gas; hydrogen concentration; explosion; detonation; flammability; static electricity; hydrogen gas inhaler; medical use; home use; market; safety

## INTRODUCTION

Production and excretion of hydrogen (H<sub>2</sub>) gas in human was reported in 1969, since then it has been regarded as non-toxic molecule.<sup>1</sup> H<sub>2</sub> was recently reported by Ohsawa et al.<sup>2</sup> as a preventive and therapeutic antioxidant. However, in 2005, 2 years ago of the Ohsawa's report, Yanagihara et al.<sup>3</sup> at our group reported that drinking of neutral H<sub>2</sub>-rich water produced by electrolysis could effectively reduce the oxidative stress induced by chemical oxidant in rats, indicating that this is a pioneering research in H<sub>2</sub> medicine. H<sub>2</sub> has also been proposed for treatment in various oxidative stress-related diseases and damages.<sup>4-9</sup> A variety of H<sub>2</sub> gas inhalers have been available in the market for clinical and home uses. However, H<sub>2</sub> is odorless and flammable or explosive ignited by static electricity. In the present study, we examined the safety of a variety of H<sub>2</sub> gas concentrations from the viewpoint of flammability and explosion. In addition, we also measured concentrations of H<sub>2</sub> gas inhalers in the market respectively.

## HOW DOES H<sub>2</sub> GAS CONCENTRATION INFLUENCE EXPLOSION?

Taiyo Nippon Sanso Pure H<sub>2</sub> gas G2 (Tokyo, Japan) was used in the first experiment for testing explosions based on a variety of H<sub>2</sub> concentrations. The H<sub>2</sub> concentration was measured by New Cosmos Electric: XP-3140 (Osaka, Japan). In order to examine the H<sub>2</sub> gas concentrations with mixture of air, we have tested flammability and explosion under five H<sub>2</sub> concentrations respectively: 4%, 10%, 15%, 20%, and 100%. Under the H<sub>2</sub> concentration of 4% and 10%, no explosion/flammability was detected. Under the 15% and 100% H<sub>2</sub> concentration, a small explosion with small sound was detected which may not cause a severe damage to user. Under the 20% H<sub>2</sub> concentration, a large explosion (detonation) was detected which may cause a

severe damage to user. From this H<sub>2</sub> concentration experiment, we understood that the H<sub>2</sub> concentration must be less than 10%. In addition, we did a systematic search of Google Scholar and PubMed using the search terms (“hydrogen gas” and “explosion” or “detonation” and “concentration”) before initiating this study on December 5, 2015, and we repeated this search on August 5, 2019. In these searches, many papers described the explosive concentration of H<sub>2</sub> gas in the mixture of H<sub>2</sub> gas and air as 4 to 75%.<sup>10,11</sup> However, a few reports reported that H<sub>2</sub> does not explode if it is less than 10% when mixed with air or oxygen.<sup>12-14</sup> Therefore, our present experimental data are supported by the latter reports.

## MEASURING H<sub>2</sub> CONCENTRATION OF H<sub>2</sub> GAS INHALERS

New Cosmos Electric XP-3140 was used for measuring H<sub>2</sub> concentrations of H<sub>2</sub> gas inhalers (15 products) in the market respectively. In the measurement of H<sub>2</sub> concentration, we used 5 apparatus and 1 apparatus for MHG-2000α and other 14 apparatus respectively. Additionally, we confirmed that the result of H<sub>2</sub> concentration is correct in each product catalog. **Table 1** shows the result of measured H<sub>2</sub> concentrations. Remember that H<sub>2</sub> gas concentration over 10% is explosive and dangerous. Consumer safety regulations for H<sub>2</sub> gas inhalers are immediately required for protecting users in order to avoid dangerous explosions.

## H<sub>2</sub> GAS IGNITED BY STATIC ELECTRICITY

We must examine a risk of static electricity ignition. According to Danger of H<sub>2</sub> Gas Explosion, and Prevention Measures (Division of Gas Safety, Institute of Chemical Technology, National Institute of Advanced Industrial Sciences and Technology, Japan), the minimum ignition energy of H<sub>2</sub> gas is 0.02 mJ.<sup>15</sup> According to electrostatic sensitivity of H<sub>2</sub> by Mizuki

**Table 1: Hydrogen (H<sub>2</sub>) gas inhalers (products) in the market**

Product name	Supplier	H <sub>2</sub> concentration (%)	Method
MHG-2000α	MiZ Co., Ltd., Kanagawa, Japan	6.6±0.2*	Electrolysis
Hycellvator	Helix Japan Co., Ltd., Tokyo, Japan	66#	
H <sub>2</sub> Life	JWS International Corp., Tokyo, Japan	66#	
HydroPower	Brain Hokkaido Co., Ltd., Hokkaido, Japan	66#	
HydroUni	Univers Co., Ltd., Tokyo, Japan	66#	
Hydrogen Generator	OPS Inc., Tokyo, Japan	66#	
AMS-H	Asklepios Medical Co., Ltd., Tokyo, Japan	66#	
La Brillier Luxe	ISMZ Co., Ltd., Osaka, Japan	98	
Hydrogen Inhaler (Table top type)	Kenko Shien Center Co., Ltd., Aichi, Japan	99	
Suiso Care	Kenko Co., Ltd., Gifu, Japan	99	
PHG-150TA	Eco Higashinippon Co., Ltd., Fukushima, Japan	99	
Suisonia	Earth Engineering Co., Ltd., Fukuoka, Japan	ND	Pyrolysis
HydroRich	Pal Corporation, Tokyo, Japan	99	Chemical reaction
Hydrogen Generator	Kanon Co., Ltd., Osaka, Japan	99	
MYC Hydro One	MYC Co., Ltd., Kumamoto, Japan	99	

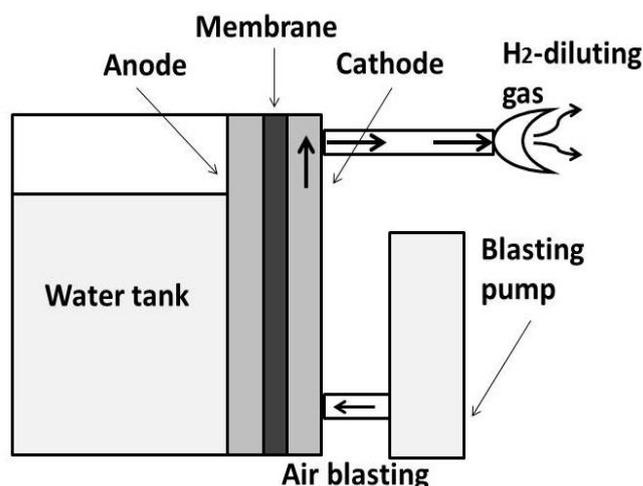

Note: \*Data are expressed as the mean ± SD of 5 apparatus. #H<sub>2</sub> and O<sub>2</sub> gas mixed type. ND: Not detected.

Yamakuma (National Institute of Occupational Safety and Health, Japan), electrostatic charge of the human body is 0.05 mJ with 1.0 kV human charging potential.<sup>16</sup> When assuming human is a capacitor of 90 pF, 1.0 kV (0.05 mJ) to 2.5 kV (0.28 mJ) human charging potential cannot be sensed by us at all. In other words, it is highly possible to easily ignite H<sub>2</sub> gas by static electricity without our recognition. 0.02 mJ ignition energy can be easily satisfied in hospital and at home. In fact, we examined to observe if an explosion would occur by a lighter flame or static electricity close to the outlet of H<sub>2</sub> gas inhaler using H<sub>2</sub> life, La Brillier Luxe, or HydRich respectively. As a result, large explosions (detonation) were detected with these three products (data not shown).

## CONTROLLING H<sub>2</sub> GAS CONCENTRATION

Although it is well known that the H<sub>2</sub> gas concentration in detonation of the mixture of H<sub>2</sub> gas and air is less than 4%,

we recently demonstrated that the detonation limit is less than 10% by our experiment and literature search.<sup>17</sup> Therefore, we developed the safe H<sub>2</sub> gas supply system (MHG-2000α). As shown in **Figure 1**, inhalation gas was prepared by mixing H<sub>2</sub> gas with air, where the H<sub>2</sub> gas was produced 140 mL/min by the electrolysis of water, and the concentration was controlled about 6.0–7.0% under the detonation limit of the mixture of H<sub>2</sub> gas and air (below 10%). Moreover, this H<sub>2</sub> gas supply system consists of raw water in an electrolyzed chamber, the diaphragm and the electrode plate. H<sub>2</sub> gas is directly generated from the electrode plate and cathode, based on the interaction between the fan on the water surface, the cathode gas and the diluted air. Thus, the concentration of H<sub>2</sub> gas near the cathode during electrolysis is always maintained below 10%, the lower limit of explosion. MHG-2000α has the new remarkable function system, which is indicated H<sub>2</sub> gas concentration, calculated from the current value and diluent gas. When it will be more than 10% of H<sub>2</sub> gas concentration, the electrolysis of water will be stopped immediately for safe.

**Figure 1: Apparatus for hydrogen (H<sub>2</sub>) gas inhalation (MHG-2000α).**

Note: The inhalation gas is prepared by mixing H<sub>2</sub> gas with air, where H<sub>2</sub> gas was produced by the electrolysis of water, and the concentration is controlled under the detonation limit of the mixture of H<sub>2</sub> gas and air.

In usual conditions, H<sub>2</sub> gas does not explode at a concentration of 10% or less. Since H<sub>2</sub> is a colorless gas with no taste or odor, we do not know the actual concentration of H<sub>2</sub> gas produced by the H<sub>2</sub> gas inhaler. Therefore, using a H<sub>2</sub> gas inhaler carries a risk of explosion. In one inhaler such as Suisonia, we could not confirm H<sub>2</sub> gas generation at all. Most of H<sub>2</sub> gas inhalers have some risks of explosion except MHG-2000α and Suisonia. As of today, there is no legislation to regulate proper production and/or use of H<sub>2</sub> gas inhalers. We should be fully aware of the risks of H<sub>2</sub> gas inhalers to prevent serious accident involving human life. To our knowledge, this is the first paper demonstrating the explosion risk of H<sub>2</sub> gas inhalers in the market. The proposed results will be useful for the information of safe H<sub>2</sub> gas inhalers.
